## Summary and Features
- BridgeSwitch – high-voltage half-bridge motor driver
  - Integrated 600 V FREDFETs with ultra-soft, fast recovery diodes
  - Fully self-biased operation – no auxiliary power supply needed
  - No external heat sink
- Instantaneous phase current output signal
- High-side and low-side cycle-by-cycle current limit
- Two level device over-temperature protection
- High-voltage bus monitor with four undervoltage threshold and one overvoltage threshold
- System level temperature monitor
- Single wire status update communication bus
- Supports trapezoidal and sinusoidal commutation

**PATENT INFORMATION**
The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations’ patents may be found at www.power.com. Power Integrations grants its customers a license under certain patent rights as set forth at https://www.power.com/company/intellectual-property-licensing/.

Important Note:
During operation, the design example board is subject to hazards including high voltages, rotating parts, bare wires, and hot surfaces. Energized DC bus capacitors require time to discharge after DC input disconnection.

All testing should use an isolation transformer to provide the DC input to the board.
1 Introduction

This document is an engineering report describing a 300 W, >98% efficiency 3-phase inverter for a high-voltage brushless DC (BLDC) motor drive using three BridgeSwitch BRD1265C devices. This design shows the device performance, internal and system level monitoring and fault protection facilitated by the high level of integration of the BridgeSwitch half-bridge motor driver IC.

This document contains the inverter specification, schematic, bill of materials, printed circuit board layout, and test setup. Provided waveform plots and performance data employed a traditional six-step trapezoidal BLDC motor control scheme. The design can also operate with other control methods such as sinusoidal commutation.

Figure 1 – Populated Circuit Board Photograph Top and Bottom View.
# Inverter Specification

The table below provides the electrical specification of the 3-phase inverter design. The results section provides actual performance data.

Notes:
1. Higher PWM frequencies require external power supply for BRD1265C devices.
2. Sensed through an external thermistor, temperature threshold depends on chosen NTC and its location, requires verification in final application.
3 Schematic

Figure 2 – BridgeSwitch 3-Phase Inverter Power Stage Schematic.
4 Circuit Description

The schematic in Figure 2 shows a 3-phase inverter employing three BRD1265C devices. The circuit enables driving a high-voltage, 3-phase brushless DC (BLDC) motor from a rectified AC input voltage. It supports various motor control schemes such as trapezoidal or sinusoidal commutation. Major and comfort appliances commonly use this type of motor because of its increased efficiency and reduced audible noise. BridgeSwitch combines two N-channel 600 V rated power FREDTs, gate drivers and controllers into a low profile surface mount package. The power FREDTs feature ultra-soft, fast recovery diodes ideally suited for hard switched inverter drives. Both drivers are fully self-supplied eliminating the need for an external power supply for the design. BridgeSwitch has device internal fault protection and system-level monitoring. Internal fault protection includes cycle-by-cycle current limit for both FREDTs and two-level thermal overload protection. System level monitoring includes high-voltage DC bus sensing with multi-level under-voltage thresholds and one over-voltage threshold as well as driving external sensors such as a thermistor for system temperature monitoring. A single-wire open-drain bus communicates all detected fault or status change conditions to the system microcontroller. The inverter board does not have heat sinks.

4.1 Input stage

The input stage provides local decoupling of the rectified AC mains through capacitors C1 and C2. Fuse F1 provides over-current protection and thermistor RT1 limits the inrush current. Resistor R25 allows optional sensing of the input DC return current.

4.2 3-Phase BridgeSwitch Inverter

The three BridgeSwitch devices U1, U2, and U3 form the 3-phase inverter. The outputs of the inverter connect to the 3-phase BLDC motor through connectors J4, J5, and J6.

4.2.1 Self-Supply Operation

Capacitors C6, C9, and C12 provide self-supply decoupling for the integrated low-side controller and gate driver. Internal high-voltage current sources recharge them as soon as the voltage level starts to dip. Capacitors C4, C8, and C11 provide self-supply decoupling for the integrated high-side controller and gate driver. Internal high-voltage current sources recharge them whenever the half-bridge point of the respective device drops to the low-side Source voltage level (i.e. the low-side FREDFET turns on).

4.2.2 PWM Input

Input signals PWMUH, PWMUL, PWMVH, PWMVL, PWMWH, and PWMWL control the switching state of the integrated high side and low side power FREDTs. The system microcontroller can access the PWM inputs through pins 3 and 4 of the connectors J1, J2, and J3. Refer to section 8.1.1 for more details.
4.2.3 Local Decoupling Capacitors
Capacitors C3, C7, and C10 provide decoupling of the high-voltage DC bus local to BridgeSwitch devices U1, U2, and U3.

4.2.4 Cycle-by-Cycle Current Limit
Resistors R8, R9, R13, R14, R20, and R21 set the cycle-by-cycle current limit level for the integrated low-side and high-side power FREDFETs. The selected value of 44.2 kΩ sets it to 100% of the default level or 3 A.

4.2.5 Instantaneous Phase Current Information
Each BRD1265C provides instantaneous phase current information through its IPH output across resistors R6, R12, and R18. The IPH pin output gain is 100 μA/A, which translates into a 1 V signal for a 1 A Drain current with the selected value of 10 kΩ. The voltage signal is available on pin 6 of connectors J1, J2, and J3.

4.2.6 System Undervoltage and Overvoltage Monitoring and Protection
BridgeSwitch U1 monitors the DC bus voltage through resistors R3, R4, and R5. Their combined resistance of 7 MΩ sets the under-voltage thresholds to 247 V, 212 V, 177 V, and 142 V. The set bus over-voltage threshold is 422 V. Capacitor C5 provides high frequency noise decoupling at the SM-pin. The FAULT-pin reports any detected bus voltage fault condition to the system MCU via the communication bus.

4.2.7 System-Level Temperature Monitoring
BridgeSwitch U3 monitors the system temperature through thermistor RT2 connected to its SM-pin. Resistor R17 tunes the threshold for a system level fault of 90 °C.

4.2.8 Fault Communication
The devices will report any detected internal and system fault through the communication bus located on pin 2 of connectors J1, J2, and J3 with each FAULT pin pulled-up to VDD via R22, R23 and R24. All three FAULT pins can be tied together in a single wire bus using only one pull-up resistor (4.7 kΩ) to VDD. In this case, R23 and R24 should be depopulated.

4.2.9 Device ID
Each BRD1265C assigns itself a unique device ID by configuring its ID pin connection: device U1 ID pin connected to BPL pin via R7 (40 μS tID), device U2 ID pin floating (60 μS tID), and device U3 ID pin shorted to SG via R19 (80 μS tID). The device ID supports FAULT bus arbitration and enables communicating the physical location of a detected fault to the system microcontroller.

4.2.10 Microcontroller Interface
Connectors J1, J2, and J3 interface the three-phase inverter stage to the system microcontroller for the PWM input, IPH output and fault output signals. VDDU, VDDV, and VDDW provide the pull-up supply for the open-drain fault output.

7 Performance Data

This section presents waveform plots and performance data gathered with the test bench described in section 8.3. The method used to measure the inverter output power is described in section 8.4.

The HV bus voltage level is 340 VDC unless stated otherwise. Light-load measurements describe the inverter operating at 50 W input power. Full load operation describes the inverter operating at 305 W input power. All measurements were performed at room ambient temperature.

7.1 Start-up Operation

Figure 4 shows the low-side and high-side BYPASS pin voltages of device U3 (phase W) after HV bus turn-on. The start-up power-up sequence follows the recommended startup sequence described in section 8.1.3. The HV bus turn-on slew rate is set to 5 V / ms.

Figure 5 depicts motor start-up waveforms captured at phase W at light load.

Table 1 – Efficiency.
Figure 20 – Inverter Efficiency.
7.6 Device and System Level Protection and Monitoring

This section demonstrates the device integrated and system-level protection and monitoring feature. The device communicates its status update including device or system level fault through the FAULT bus. Each device status word consists of device ID arbitration followed by a 7-bit word pattern and a parity bit. Refer to section 8.2 for the status word encoding summary.

7.6.1 Device Level Protection

Figure 21 and Figure 22 depict the integrated current limit function at device U3 (phase W) and associated status update reported on the FAULT bus.

In Figure 21, the current limit resistor $R_{XL}$ was increased to 90 kΩ for test purposes. This sets the overcurrent limit of the Phase W device low-side FRED Fet to 1.5 A.

In Figure 22, the current limit resistor $R_{XL}$ of 44.2 kΩ sets the default current limit of 3 A.
Figure 23 and 24 depict the low-side FREDFET over-temperature warning (OTW) and shutdown (OTS) function and the associated status update reported on the FAULT bus. A localized external heat source applied to the device package forced the temperature rise.

**Figure 23** — Temperature Warning, Phase W.
Status Update: 000 01 0 0 (OTW).

Lower: \( V_{FAULT} \), 2 V / div., 20 ms / div.
Zoom: 50 μs / div.
7.6.2 System Level Monitoring

The test results shown in Figures 29 to 32 demonstrate the integrated HV bus UV monitoring function and status reporting through the communication bus (FAULT pin). Device U1 (Phase U) senses the bus. Its $t_{ID} = 40 \mu s$. The input voltage slew rate for all bus monitoring tests is $2 \text{ V} / \text{ms}$.

**Figure 29** – Bus Sensing - Brown-out.
Bus Voltage Drop 340 to 240 VDC.
Status Update: 010 00 0 0 (UV100).
Upper: $V_{BUS}$, 100 V / div.
Middle: $V_{HB}$, 300 V / div.
Lower: $V_{FAULT}$, 2 V / div., 20 ms / div.
Zoom: 50 $\mu$s / div.

**Figure 30** – Bus Sensing - Brown-out.
Bus Voltage Drop 240 to 200 VDC.
Status Update: 011 00 0 0 (UV85).
Upper: $V_{BUS}$, 100 V / div.
Middle: $V_{HB}$, 300 V / div.
Lower: $V_{FAULT}$, 2 V / div., 20 ms / div.
Zoom: 50 $\mu$s / div.

**Figure 31** – Bus Sensing - Brown-out.
Bus Voltage Drop 200 to 160 VDC.
Status Update: 100 00 0 0 (UV70).
Upper: $V_{BUS}$, 100 V / div.
Middle: $V_{HB}$, 300 V / div.
Lower: $V_{FAULT}$, 2 V / div., 20 ms / div.
Zoom: 50 $\mu$s / div.

**Figure 32** – Bus Sensing - Brown-out.
Bus Voltage Drop 160 to 130 VDC.
Status Update: 101 00 0 0 (UV55).
Upper: $V_{BUS}$, 50 V / div.
Middle: $V_{HB}$, 150 V / div.
Lower: $V_{FAULT}$, 2 V / div., 20 ms / div.
Zoom: 50 $\mu$s / div.
Figure 33 and Figure 34 illustrate the HV bus OV monitoring feature. Device U1 (Phase U) stops switching and reports the OV fault condition as soon as the bus voltage exceeds the set OV threshold (422 V with 7 MΩ). Switching resumes after the bus voltage level drops again below the detection threshold minus the hysteresis (33 V with 7 MΩ).

**Figure 33 —  BUS Sensing - OV Threshold Fault.**

- Middle: $I_{PHASE_U}$, 1 A / div.
- Lower: $V_{FAULT}$, 2 / div., 10 ms / div.
- Zoom: 50 μs / div.

**Figure 34 —  BUS Sensing - OV Threshold Cleared.**
- Bus Voltage Drop 430 to 340 VDC.
- Status Update: 000 00 0 0 (OV Cleared).
- Upper: $V_{BUS}$, 100 V / div.
- Middle: $I_{PHASE_U}$, 500 mA / div.
- Lower: $V_{FAULT}$, 2 / div., 10 ms / div.
- Zoom: 50 μs / div.
Figure 35 and Figure 36 illustrate the system-level temperature monitoring function. The device checks the resistance connected to the SM pin every second for a period of 10 ms.

The fault was simulated by applying a localized external heat gun to sense thermistor RT2.
7.6.3 Status Query

Figure 37 to Figure 40 illustrate a status query sequence initiated from the system MCU by pulling the status bus low for $t_{\text{SYSID}}$. The DC bus voltage was set to 240 VDC for this illustration. Consequently, the device U1 (Phase U) which monitors the bus voltage, reports a UV100 condition during its status update as shown in Figure 38. The two other devices report an all clear during their respective status update.

Figure 37 – Status Query - System MCU Request. Request Time $t_{\text{SYSID}}$: 160 $\mu$s.
Upper: $V_{\text{BUS}}$, 100 V / div.
Lower: $V_{\text{FAULT}}$, 2 V / div., 200 $\mu$s / div.
Zoom: 50 $\mu$s / div.

Zoom: 50 $\mu$s / div.
7.7 Abnormal Motor Operation Tests

This paragraph provides results during abnormal operation tests for appliances with motors as described in IEC 60335-1 (Safety of household and similar electrical appliances). The tests include:

- Operation under stalled motor conditions
- Operation with one motor winding disconnected
- Running overload test

The test results demonstrate the integrated protection features of the BridgeSwitch under such abnormal operations. The motor operates at 300 W and 5000 RPM at 340 Vdc rated voltage for all test cases except for the overload test.

7.7.1 Operation Under Stalled (Motor) Conditions

Figure 41 and Figure 42 depict the motor phase currents and overcurrent fault flag on Phase V when doing startup with a motor stalled condition. The inverter is continuously supplied for a period of 10 minutes at the rated voltage at this condition. The motor is non-operational with no device or motor damage during or after this test.

**Figure 41** – Motor Stalled at Start-up Condition.
- First: V_FAULT, 2 V / div.
- Second: I_PHASE_U, 4 A / div.
- Third: I_PHASE_V, 4 A / div.
- Fourth: I_PHASE_W, 4 A / div. 40 ms / div.

**Figure 42** – Fault Flag: 000 00 1 0.
- Low-side Overcurrent, Phase V.
- First: V_FAULT, 2 V / div.
- Second: I_PHASE_U, 4 A / div.
- Third: I_PHASE_V, 4 A / div.
- Fourth: I_PHASE_W, 4 A / div., 40 ms / div.
- Zoom: 1 ms / div.
Figure 43 and 44 depict the motor phase currents and fault flags when the motor is stalled during running operation. The inverter is continuously supplied for a period of 10 minutes at the rated voltage at this condition. BridgeSwitch reports over-current fault conditions, and the motor is non-operational with no device or motor damage during the test or after the fault is removed.

**Figure 43** – Motor Stalled at Running Condition. Multiple Overcurrent Flags Reported.
- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE U}}$, 4 A / div.
- Third: $I_{\text{PHASE V}}$, 4 A / div.
- Fourth: $I_{\text{PHASE W}}$, 4 A / div. 1 s / div.

**Figure 44** – First Fault Flag: 000 00 1 0. Low-side overcurrent, Phase W.
- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE U}}$, 4 A / div.
- Third: $I_{\text{PHASE V}}$, 4 A / div.
- Fourth: $I_{\text{PHASE W}}$, 4 A / div., 1 s / div.
- Zoom: 1 ms / div.
7.7.2  Operation with One Motor Winding Disconnected

Figure 45 and 46 depict the motor phase currents and fault flag during operation with one motor winding disconnected.

**Figure 45** – Phase V Winding Disconnected.
- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE}U}$, 4 A / div.
- Third: $I_{\text{PHASE}V}$, 4 A / div.
- Fourth: $I_{\text{PHASE}W}$, 4 A / div., 40 ms / div.

**Figure 46** – Fault Flag: 000 00 1 0.
- Low-side Overcurrent, Phase U.
- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE}U}$, 4 A / div.
- Third: $I_{\text{PHASE}V}$, 4 A / div.
- Fourth: $I_{\text{PHASE}W}$, 4 A / div., 40 ms / div.
- Zoom: 1 ms / div.

The device reports overcurrent status updates and the motor operates abnormally before completely stalling with no device or motor damage.
7.7.3  Running Overload Test

Figure 47 and Figure 48 depict the motor phase currents and status update flag during a running overload fault condition. During this test, the motor load is increased such that the current through the motor windings increases by 10% and until steady conditions are established. The load is then increased again and the test repeats until the BridgeSwitch protection engages or the motor stalls.

With the motor stalled condition, the inverter is supplied continuously for a period of 10 minutes at the rated voltage. Every device reports status updates and the motor is non-operational with no device or motor damage.

**Figure 47** – Running Overload Test >450 W.
- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE }U}$, 4 A / div.
- Third: $I_{\text{PHASE }V}$, 4 A / div.
- Fourth: $I_{\text{PHASE }W}$, 4 A / div., 1 s / div.

**Figure 48** – First Fault Flag: 000 00 1 0.

- First: $V_{\text{FAULT}}$, 2 V / div.
- Second: $I_{\text{PHASE }U}$, 4 A / div.
- Third: $I_{\text{PHASE }V}$, 4 A / div.
- Fourth: $I_{\text{PHASE }W}$, 4 A / div., 1 s / div.
- Zoom: 1 ms / div.
8 Appendix

8.1 Inverter Circuit Board Manual

8.1.1 Connectors

Figure 49 shows locations and functions of all connectors to and from a test system.

The high-voltage DC bus connects to the inverter through two through-hole mount test points, J7 and J8. The positive input terminal should connect to J8, and the negative input terminal should connect to J7.

Control input signals and a system monitor and communication output signals connect to the test system through three 8-position header breakaway connectors J1, J2, and J3 (Figure 50). Figure 50 depicts physical dimensions and pin numbers.
Table 2 lists all input and output signals on each of the three connectors for control input, phase current signal and status communication output.

*Table 3 – Test Points.*
8.1.3 *Recommended Start-up Sequence*

BridgeSwitch devices have internal self-supply supporting commutation PWM frequencies up to 20 kHz. To ensure sufficient supply voltage levels across the BPL pin capacitor and the BPH pin capacitor at inverter startup, the system microcontroller (MCU) should follow the recommended power-up sequence depicted in Figure 52.

![Figure 52 – Recommended Power-up Sequence with Self-Supplied Operation.](image)

Table 4 lists activities occurring during the recommended power-up sequence.

<table>
<thead>
<tr>
<th>Time Point</th>
<th>Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>$t_0$</td>
<td>• High-voltage DC bus is applied</td>
</tr>
</tbody>
</table>
| $t_1$      | • Internal current source starts charging BPL pin capacitor once HD-pin voltage reaches $V_{HD(START)}$  
             • System MCU may start setting low-side power-FREDFET control signal INL to high |
| $t_2$      | • BPL pin voltage reaches $V_{BPL}$ (typ. 14.5 V)  
             • Device determines external device settings  
             • Internal Gate drive logic turns on low-side power FREDFET after device setup completes and once INL becomes high or if it is high already  
             • Internal current source charges BPH pin capacitor |
| $t_3$      | • BPH pin voltage reaches $V_{BPH}$ with respect to HB pin (typically 14.5 V)  
             • Device starts communicating successful power-up through fault pin  
             Note: The device does not send a status update if the internal power-up sequence did not complete successfully |
| $t_4$      | • BridgeSwitch is ready for state operation (indicated by communicated status update at time point $t_3$)  
             • System MCU turns off low-side FREDFET |

**Notes:**
1. Includes XL pin open/short-circuit fault and IPH pin to XL pin short-circuit.
2. Includes internal communication loss, supply out of range, and XH pin open/short-circuit fault.

**Figure 53** – Status Word Encoding.
8.3 Test Bench Set-up

Figure 54 depicts the test bench used to gather the performance data presented in this report. It consists of:

- 3-phase inverter using BRD1265C with interface board for MCU and hall sensor interface
- Cypress CY8CKIT-042 PSOC4 MCU motor control unit (not visible)
  - Trapezoidal control with 12 kHz high-side PWM
- Shunde Hopemotion brushless DC motor 57BL110S30-3150TFO
  - 310 VDC, 5000 RPM, 0.7 Nm, 300 W, 4 poles, hall sensor outputs
- Dongguan ZL Electromechanics hysteresis brake including control unit
- Programmable DC input source Chroma Model 61502 (not shown)
- Bench power supply for MCU control board and motor brake controller

![Figure 54 – Test Bench Set-up.](image)
8.4 Inverter Output Power Measurement

3-phase inverter output power $P_{OUT}$ and efficiency measurements apply the “two wattmeter” method illustrated in Figure 55 below.

$$P_{OUT} = P_{CH1} + P_{CH2}$$

**Figure 55** – Inverter Output Power Measurement.
9 Notes

Described below are the oscilloscope model and settings used to gather the waveform plots presented in the performance data section of this document:

- In section 7.1 (Start-up operation) up to section 7.6 (Device and system level protection): 6050A Lecroy 500 MHz oscilloscope set to 20 MHz Bandwidth with 3-bit resolution enhancement.
- In section 7.7 (Motor abnormal tests): RTO2004 Rhode & Schwarz 600 MHz oscilloscope set to 20 MHz bandwidth.

Reference Designs are technical proposals concerning how to use Power Integrations’ gate drivers in particular applications and/or with certain power modules. These proposals are “as is” and are not subject to any qualification process. The suitability, implementation and qualification are the sole responsibility of the end user. The statements, technical information and recommendations contained herein are believed to be accurate as of the date hereof. All parameters, numbers, values and other technical data included in the technical information were calculated and determined to our best knowledge in accordance with the relevant technical norms (if any). They may base on assumptions or operational conditions that do not necessarily apply in general. We exclude any representation or warranty, express or implied, in relation to the accuracy or completeness of the statements, technical information and recommendations contained herein. No responsibility is accepted for the accuracy or sufficiency of any of the statements, technical information, recommendations or opinions communicated and any liability for any direct, indirect or consequential loss or damage suffered by any person arising therefrom is expressly disclaimed.

Power Integrations reserves the right to make changes to its products at any time to improve reliability or manufacturability. Power Integrations does not assume any liability arising from the use of any device or circuit described here.

Power Integrations makes no warranty herein and specifically disclaims all warranties including, without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement of third party rights.

Patent Information
The products and applications illustrated herein (including transformer construction and circuits' external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations’ patents may be found at www.power.com. Power Integrations grants its customers a license under certain patent rights as set forth at http://www.power.com/ip.htm.
